

To run an initial load when a delta has failed.

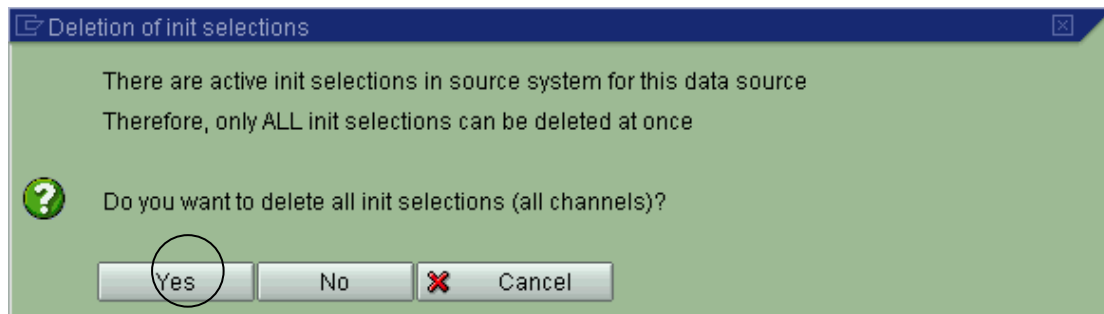

An initial load is done on master data when a previous delta load fails and can't be restarted.

- 1) Under InfoSources in the Administrator Workbench, search for the InfoSource name of the failed Master Data. In this instance it is 0WBS_ELEMT_ATTR*.
- 2) Open the Infopackage with "INIT" in the name, which here is 0WBS_ELEMT_ATTR_INIT.
- 3) From the Menu Bar, select Scheduler → Initialization options for source system

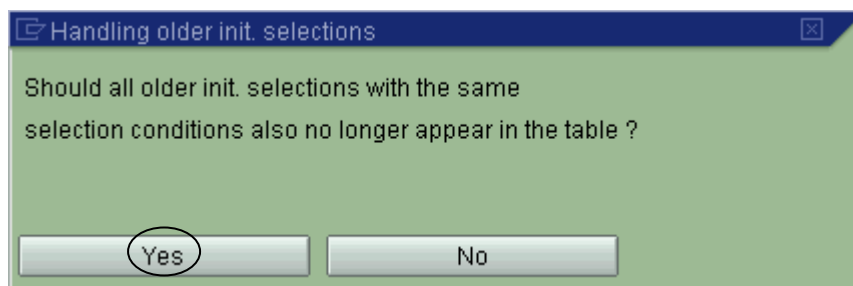

Select the entry and delete it.

Select "Yes" on the prompts.

Run the INIT InfoPackage.
